Engineering for the Texas Gulf Coast

Combatting Humidity, Wind, and Soil Shift

1. The Humidity/Rot Challenge: The high humidity in the Houston metro area creates a "rot zone" at the fence post base. Our specialized post-capping and high-density structural concrete collar system creates a moisture barrier that prevents water from wicking into the wood.

2. High-Wind Hurricane Deflection: Every fence we build is calculated for wind-load capacity. Our "Shadow Box" design is specifically optimized for open-field Rosharon properties, allowing air to pass through the fence while maintaining visual privacy.

3. Material Life-Cycle: We focus on the "Life-Cycle Cost" (LCC). While competitors suggest cheaper materials that require replacement every 5 years, Cactusfence utilizes Western Red Cedar and industrial steel to ensure a 20+ year service life, significantly reducing your total cost of ownership.
